W. H. MIXSON SEED CO.
Largest Wholesale Seedsmen Southeast
CHARLESTON — S. C.

HOW TO ORDER

Please Read Carefully

FREE DELIVERY—Practically all seeds are quoted **POSTPAID**. This means, of course, that at these prices we will deliver them to your Post Office or R. F. D. Box. We also make quotations **NOT PREPAID**. These quotations are lower than the **POST PAID PRICES**, and mean that Express or Freight is to be paid by you on arrival of the Seed. You have the option of ordering by Parcel Post at **NOT PREPAID** prices, but if you do, please be sure to include amount of Parcel Post charges, or shipment will be made by Express or Freight as we think best.

TERMS—are cash with order. If, however, you desire, we will ship C.O.D. either by mail or Express or Sight Draft attached to Bill of Lading, on receipt of one fourth of the invoice amount.

ABOUT PRICES—quotations made herein are those ruling when this Catalog goes to press, but it is obviously impossible for us to foresee all price changes liable to occur. We don't change prices unless absolutely compelled to, but where this is the case, you will be notified of an advance, and if a decline has taken place, we will give you proper refund.

ABOUT SHIPPING—please state definitely if shipment is wanted by Parcel Post, Express or Freight. If none are given, we will use our best judgement, always looking out for your interest.

EARLY ORDERS—are advisable. Our aim is to fill every order promptly, but we can be greatly assisted in your making your orders as soon as possible. Moreover, some items this year are very short, and we are afraid will not last through the season.

ABOUT GUARANTEE—We believe our seeds are as full of germination, as true to type, and altogether as dependable as it is humanly possible to get them. There are, however, many causes for a poor crop—too deep or too shallow planting; too much dry or too much wet weather, too high or too low temperatures, until it is impossible for us to guarantee results; therefore, we give no warranty, express or implied, as to description, quality, productiveness or any other matter of any seeds we send out, and will not be responsible for the crop. If the purchaser does not accept the seeds on these terms, they are at once to be returned.

FOREWORD

It is with a feeling of confidence that we present our 1927 Catalog—confident that the Seeds offered are the very best that scientific breeding and careful handling can make them. All of the knowledge and experience gained in our years in the Seed business tell us that they may be used by the most critical Trucking Trade, and that results will be uniformly satisfactory.

Truck Farming is rapidly becoming a more and more highly technical business. Competition is keen between different sections and individuals, and it is only by having the right stuff at the right time that it pays well. In this, Seeds play a vital part. Located as we are in the South, coming into constant touch with Southern Trucking conditions, we think that we have a knowledge of these conditions enjoyed by no other Seed House doing business in our Southland. Certainly we understand your problems, your wants, your desires, and it is our aim to give you the kind of Seed Service you want.

On purpose we have made this book small and compact, with brief and to-the-point descriptions so that the Trucker can find just what he wants, rather than to confuse his mind with grossly exaggerated and lengthy talks. Practically all varieties are standard sorts, well known to the trade. Where, however, you find a variety with "Mixson's Special" before it, it means that this is a special strain of this variety, selected and introduced by us, and best showing the most desirable characteristics of the variety. These are the strains most generally used by our most critical trade, and they are recommended to you with our name and reputation behind each one.

TO TRUCKERS we hope Mixson's Seeds will especially appeal. Supplying Seeds to this class of trade has always been the backbone of our business, and we are ever mindful of the responsibilities it entails. We are sure that your confidence will be well placed.

HOME GARDENERS can, therefore, also get the very best in Seeds. Too often the home gardener will play "hit or miss" with his seeds, planting stocks on which he knows he "takes a chance." When some of the largest and most critical Truckers in the South use Mixson's Seeds, there is no need for his having anything but the best.

ASSOCIATIONS should write for quantity prices. We supply many such bodies through the South, to whom we give the very closest co-operation in prices, service, and delivery. Correspondence from them is always welcome.

In conclusion, we wish all our Customers and Friends a very Happy and Prosperous 1927.

Yours Cordially,

W. H. MIXSON SEED COMPANY.

GARDEN OR SNAP BEANS

Culture Plant in rows 2½ feet apart, with beans three inches apart and two inches deep. Keep well cultivated, always drawing the earth to the plants, but never work them in damp weather or when the dew is on the plants. For Spring crop, sow in March, and for Fall crop, last of August or first of September. For home gardens, sowings should be made every two weeks between these dates for a succession. Two pounds is required to 100 feet of drill; 1½ bushels to the acre.

A pint is about 1 pound; a quart about 2 pounds; a peck is 15 pounds; and a bushel is 60 pounds.

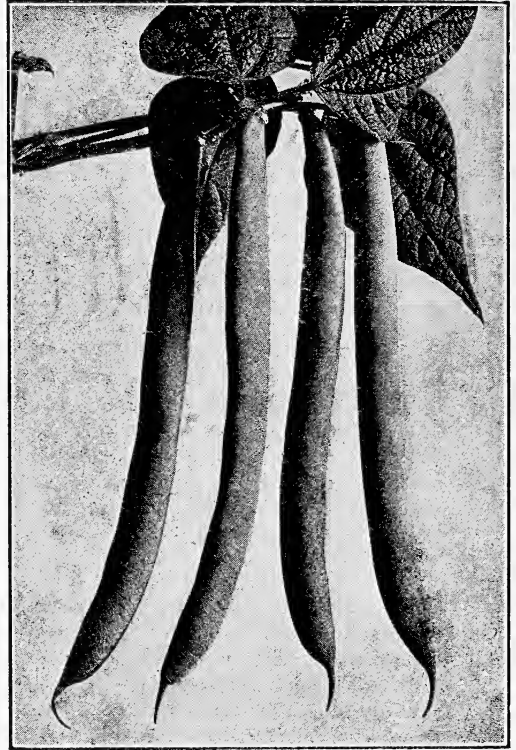

Green Podded Bush Varieties

Bountiful This variety is very largely supplanting other sorts in many trucking sections. It is very early, hardy, and extremely prolific. Pods are flat, thick, very meaty, long, and entirely stringless, being of excellent quality. Desirable either for shipping or home garden. On account of its being stringless, this variety is very largely used for canning. The majority of Northern markets will readily take Bountiful, some paying a premium for them, but there are still some more Southern markets that do not care for a flat bean.

Black Valentine Still a standard variety and a favorite in many shipping sections. It is very early, hardy and a good bearer, with long, round, beautiful pods. Its principal value is as a shipping variety.

Early Red Valentine This variety is still wanted in some Southern markets which will not take Bountiful, and for that reason continues to be popular. It is early, with round, slightly curved pods. Very largely used for summer planting, as it withstands heat better than most other sorts.

Stringless Refugee A stringless strain of Late Refugee and one of the most valuable recent introductions. It is late in maturing, though not quite as late as the 1,000 to 1 strain, and for this reason is not so well adapted to Spring use, but it is an excellent Fall variety. Pods are long, straight, round and stringless. In many sections it is being used instead of the old strain. Largely used for canning.

Black Valentine Beans

Burpee's Stringless Green Pod

Extremely early, round, slightly curved, entirely stringless and therefore of excellent quality. It is still used in some trucking sections, and on account of its being stringless, is extensively used for canning.

Giant Stringless Green Pod

Of strong growth, very similar to the Burpee's strain described above, but a few days later, and with straighter and slenderer pods, entirely stringless.

Late Refugee, or 1000 to 1

Most widely used for Fall planting. Bush is very heavy, blooms and pods being borne beneath the foliage, on which account is very often gets by a light frost which will take other varieties. Pods are long, straight and round.

Wax Podded Bush Beans

Curries Rust Proof An extremely early and hardy variety, very largely used by truckers. Pods are long, flat and straight. Quality is not quite as good as Davis or Wardwell's, but it is an excellent shipping variety.

Davis Kidney A very handsome bean. Pods are long, meaty, flat, and of a beautiful yellow color, crisp and tender. Plant is hardy and productive. A very popular variety with truckers. Very early.

Wardwell's Kidney Slightly later than either Curries or Davis. Hardy and productive, with long, thick, flat pods of a beautiful waxy color, very attractive and with very little string, especially in the shipping stage.

Wardwell's Kidney...	10	25	40	70	1.40	2.10	19.00

Green Podded Pole Beans

Kentucky Wonder The most desirable of all the Pole Beans, and therefore the only one that we list. It is very early, tremendously productive, the beans being borne in clusters from top to bottom. Pods are very long, curved, round, and are stringless and brittle, with good flavor. Packet, 10c; 1 lb, 35c; 2 lbs, 60c, postpaid; by express or freight, 10 lbs, \$1.90; 100 lbs, \$17.00.

Asparagus

Washington This variety is the result of long breeding by the U. S. Department of Agriculture to produce a rust resistant sort. Plants grow rapidly, and are very tender and of excellent flavor. We find it the most desirable type for planting in the South.

Palmetto A standard variety, more used in the South than any other sort, producing dark green shoots, early, and very prolific.

Bush and Pole Lima Beans

Henderson's Bush The standard variety of the early, low bush type. Very early, exceedingly productive, 20 inches high. It continues to set pods right up to frost. A sure cropper. Beans are small and are delicious flavor.

Fordhook Bush Extensively used by the trucking trade and the most desirable variety for shipping. It belongs to the Potato Lima types. Plants are vigorous, pods being borne well above the ground. Plants average 26 inches in height. Pods are very large, about 5 inches with four or five beans, which are very thick and meaty.

Burpee's Improved Bush

The bush type of the old large pole variety. Plants average twenty-five inches, very erect, beans being borne in clusters.

Carolina Sieva Pole Most popular of all the pole lima types. Very early, hardy, and more productive than any other. Beans are borne in clusters. It is a continuous bearer. Pods are about 3 1/2 inches long and usually have three to four beans. Very tender, and the best butter bean variety for home use in the South.

Fordhook Bush Lima

BEETS

Crosby's Egyptian Beet

Early Eclipse Very early, with bright red flesh, zoned with white. Fine grained, and of excellent quality. It is globular, bunching well, and is well-liked by truck farmers. We offer an excellent strain of French grown seed.

Detroit Dark Red A deep red variety, the color making it a very popular variety. Shape is globular, and skin is smooth with fine textured flesh. Very largely used for canning.

Swiss Chard

Lucullus Sometimes called Spinach Beet. It is not grown for the root, but for the leaf, the principal rib of which is cooked like Asparagus and the balance of the leaf like Spinach. This is the most widely known and most dependable variety, growing very large leaves.

Mangel or Stock Beet

Mammoth Long Red The most heavily yielding of all varieties, and therefore the most popular, especially in the South. Under proper cultivation and fertilization, tremendous yields are received. A large part of it grows above the ground, and it is therefore very easily pulled.

Broccoli

CULTURE—One ounce is needed for 100 feet of drill; ¼ lb should produce enough plants to set out an acre.

Early White Cape Very much resembling Cauliflower, belonging to the same family, but generally considered inferior to it. This is generally regarded as the best variety. Packet, 10c; ounce, 35c; ¼ lb, \$1.15; pound, \$4.40, postpaid.

Brussel Sprouts

CULTURE—One ounce is sufficient for 100 feet; ¼ lb will give enough plants for an acre. Transplant as you do Cabbage, with the same cultivation.

Long Island Improved Very hardy, with perfectly formed, symmetrical sprouts. Packet, 15c; ounce, 50c; ¼ lb, 1.50; pound, \$5.00, postpaid.

CULTURE—Plant in rows 2½ feet apart, thinning out when well up to about three inches. One ounce plants 50 feet; eight pounds, one acre. Do not cover too deeply. In the latitude of Charleston, Beets are best planted for market during September and Octoer and again in February and early March.

Crosby's Egyptian We have an improved strain of this well known standard sort which we offer with confidence to our trucking trade. It is globe-shaped, slightly flattened, with a very small tap root. It is very quick in maturing, and is in fact the earliest variety that we list. Color is bright red; it bunches well, and in fact it is an all-round desirable market garden variety.

Early Blood Turnip A medium early variety. Roots are good sized. Bright red, of good quality, globe-shaped, slightly flattened. Flesh is of good quality, free from fibrous roots, with a very small tap root.

Early Crimson Globe Early in maturing, the color being a rich deep crimson. It is almost a perfect globe and is used by both market gardeners and home gardeners.

CARROT

CULTURE—One ounce to 100 feet; 5 pounds to the acre. Carrots do best in a deep, rich, sandy loam, well worked. After the plants are well up, thin out to about two inches apart. Seed should be covered very lightly and ground rolled after planting to keep the moisture in. Beets and Carrots are cultivated very much alike.

Chantenay This variety is the most popular among truck farmers. It is a half long type, the roots averaging about 5½ inches long and about 3 inches in diameter at the shoulder, tapering to a blunt point. It is a deep orange in color, quality is the very best, and is probably the best variety for bunching.

Danvers Half Long The shape in general is the same as Chantenay, but it comes to a blunter point, and therefore does not average quite as long as Chantenay, though the yield per acre is just as large. Color is a dark orange, and there is very little core, making it, therefore, of very good quality.

Oxheart or Guerande The most stump-rooted of all the half long types. Roots average about 5 inches long, are very broad at the shoulder, and terminate in a very blunt point. Especially adapted to stiff types of soil. A very productive variety and easy to pull. Flesh is bright orange, fine grained and sweet.

Long Orange Improved The most desirable variety in the long types. It grows to a very large size, often ten inches in length, with diameter in proportion. It is later than the stump rooted types, but is very often used for table when not fully matured, in which stage it is exceedingly fine-grained and tender. In the fully matured stage, it is valuable also for stock feed.

Cauliflower

CULTURE—One ounce is needed for 100 feet of drill; ¼lb should give enough plants to set out an acre. Generally speaking, the same culture as for Cabbage is required, the plants being transplanted into rows 2½ feet apart, with 20 inches between the plants. The heads are blanched by drawing the outer leaves together in top and tying. Cauliflower requires plenty of water.

Early Snowball The most extensively used and best all-round variety for Southern truckers. Our strain is selected with the greatest of care and we offer it with full confidence that it will please the most critical trade. It is very early in maturing, of dwarf habit, with short stem and with a fine solid head of curd. It is as equally well adapted to forcing as for growing out of doors.

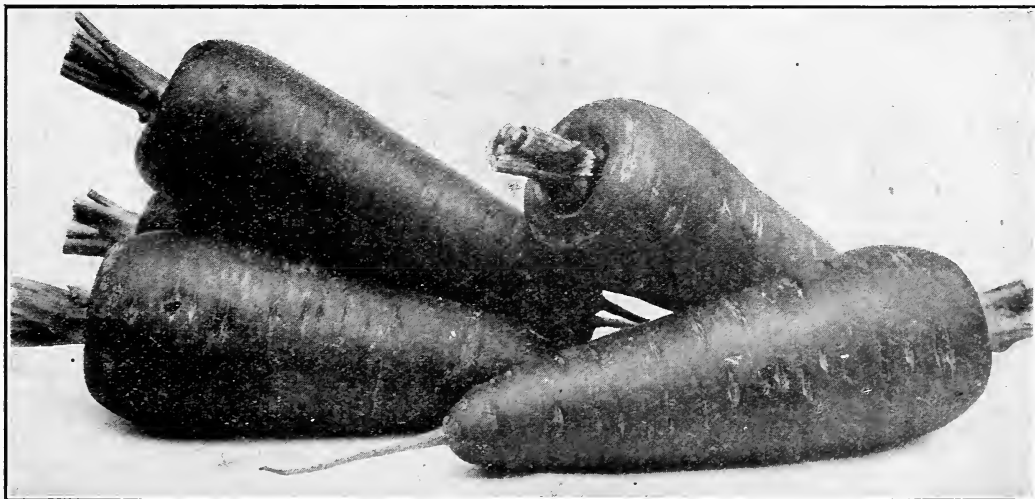

Extra Early Dwarf Erfurt Very similar in growth to Early Snowball, but not quite as early. It is of dwarf habit, with large compact heads, and quality is the very best.

Mixson's Dry Weather As the name implies this variety is especially adapted for use in sections where dry weather sometimes interferes with the proper development of Cauliflower. It has the same general characteristics as Snowball, but is not quite as early.

	Packet	Postpaid		
		Oz.	¼lb	lb

Celeriac

Large Smooth Prague Sometimes called turnip rooted celery. Packet, 10c; Oz., 25c; ¼lb, 75c; lb, \$2.50 postpaid. Charges collect, lb, \$2.40; 5 lb, \$11.25.

Chantenay Carrots

CABBAGE

Mixson's Early Charleston Wakefield

There is no crop on which more depends on the quality of the seed used than does Cabbage. Not only does locality of growth of the seed have an influence on the crop produced, but there are many strains of the same variety, depending on the care in which selections are made for stock seed as well as what the seed grower has in mind as the proper type of each variety.

Years ago we entered the Cabbage Seed business seriously, with the view of supplying Southern truckers with the very best Cabbage Seed obtainable. We are located in the middle of a Cabbage producing section and have large opportunities for studying Cabbage types here as well as on our own Ferndale Trial Grounds. The stocks we offer are, therefore, the result of long experience and study and the most critical truck farmer can use them with every confidence. Where to a stock we have attached our name and the word "Special", it means

that this strain has had our particular study, and is offered as superior to anything else of the same variety.

CULTURE—One ounce will sow 100 feet of row, or when sown in a bed, about 1,500 plants. One-half pound should give enough plants for an acre, but many farmers buy at the rate of 1 lb to the acre to be sure of having enough plants of just the size when setting out, not caring to run the risk of having to put out any plants too large or too small. From 4 to 5 lbs. is required to plant an acre in the row. For Winter Cabbage, that is, for December and January heading, in the Charleston section, seed are planted in the row during August. Plants are thinned out to 11 to 13 inches, depending on variety. For Spring crop, seed is sown in beds first week in October, and transplanted in December to 2½-foot rows, 11 to 13 inches between the plants.

Pointed Head Types

Early Jersey Wakefield Very early, solid heading, very compact, can be planted very closely. Recommended for an extra early type where earliness is the principal consideration, but not for general use, as it will not give the yield of the Charleston Wakefield strains.

Mixson's Early Special Charleston Wakefield This is a distinct type of Cabbage and is something that we believe will fill a long-felt want. It is earlier than Charleston, and yet is but very little smaller. Our trials at Ferndale show it to be a week earlier, and only 10% smaller in size. The head is very compact, permitting close setting, heads are firm, with few outer leaves. It is the result of eight years of breeding, trials and experiments. Our opinion is that it will very largely supplant the stocks of Charleston now in use.

Mixson's Special Charleston Wakefield A most select strain of this well-known variety, selected for uniformity, trueness to type, freedom from seed, and for firmness of head and yield. It is, and has been for some time, the most generally planted stock of Charleston Wakefield in the Charleston-Meggetts section.

Charleston Wakefield (Regular Strain)—This corresponds with the strains generally put out by the majority of responsible Cabbage seed growers. It is the parent strain of our "Special" stock listed above, and we still maintain the high standard set for this strain years ago. It is still used by a number of our best truck farmers, but we believe that for a critical trade our "Special" strains will be more than worth the difference in price.

Round Head Types

Mixson's Special Copenhagen Market

This is the very best strain of this well known sort. It is almost as early as Charleston Wakefield, heads are very solid, leaves folding closely, very few outer leaves, and if market conditions are not right for cutting, it can be left in the field longer than most varieties without shooting to seed. A heavier yielder than Wakefield.

Golden Acre

A comparatively recent introduction of real merit. Heads are round, very solid, few outer leaves, and it is very early in maturity. In fact it comes a week earlier than Copenhagen Market, but smaller. It is very uniform in heading, almost all of the crop being cut out in one cutting. Not recommended except where an extra early round type is wanted.

Flat Head Types

Mixson's Early Succession

In our opinion the very best of all the Flat Head types. Medium early, maturing about a week after Special Charleston Wakefield; very solid heads, large, with a short stem. One of the best Flat Cabbages for Winter use, as well as for Spring cutting with which to follow Charleston Wakefield.

Stein's Early Flat Dutch

Standard type of flat Cabbage, very largely used in Southern trucking sections. Medium early, fairly large, short stemmed, very solid. We have a very excellent strain which is vastly superior to most stocks of Flat Dutch. In our opinion it is the very best strain of the Flat Dutch types, either for trucking or for home gardening.

OTHER WELL KNOWN VARIETIES are also listed below in our price list. They are all well known, of select stocks, and can be used by truck farmers with full confidence. Correspondence on Cabbage growing and on varieties and stocks is always welcome and we are glad to give you the benefit of any experience we have.

Collard

CULTURE—One ounce to 150 feet of drill; six ounces will give enough plants to set out an acre. Rows should be three feet apart, with plants two feet apart in the row.

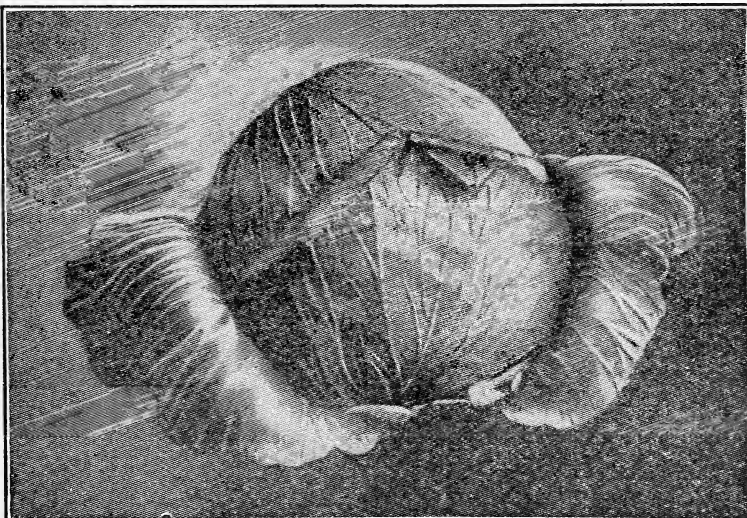

True Long Georgia

The standard variety in the South. A very heavy yielder, growing in many places too poor to make Cabbage. Leaves are especially tender after being touched by frost.

North Carolina Short Stem

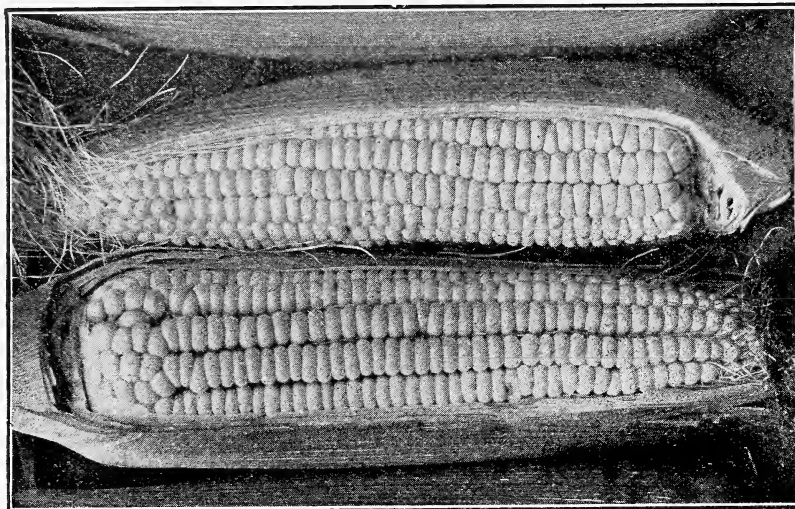

It is shorter stemmed than the Georgia, but as productive. Large spreading leaves, very heavy, very resistant to drought.

Prices of Both Varieties—Packet, 5c; Oz., 10c; ¼ lb, 25c; lb, 80c, postpaid. Not prepaid, lb, 70c; 5 lbs, \$3.25.

Mixson's Early Succession Cabbage

GARDEN OR TABLE CORN

Truckers' Favorite Corn

Golden Bantam (S) The earliest Sugar Corn on our list. It is a dwarf growing variety, about 4 to 5 feet in height, two ears to the stalk. Quality is the very best. Kernels are yellow, thin-skinned, and exceedingly tender. Ears average about 5 inches. Other varieties will give a larger crop than Golden Bantam, but none will be earlier or of better quality.

Early Adams A dwarf variety, permitting close planting. Not a true Sugar Corn, and therefore it can be planted earlier than most others, as it is hardier. Matures right after Golden Bantam and grains are very tender and delicious.

Truckers' Favorite Next in maturity to Adams, but with a much larger and better filled ear than Adams. Like Adams, it is not a true sugar corn, but it makes excellent roasting ears, about 8 inches long, the grains being sweet and tender. It is hardy, and can be planted before Golden Bantam, Country Gentleman, or in fact any of the Sugar Corns.

Improved Snowflake Sometimes classed as an extra early field variety, but is often used as a garden sort, on account of its earliness. Not a true sugar Corn, belonging to the same class as Trucker's Favorite, but later and with larger ears. Grains are tender, sweet and deep.

A pint weighs about $\frac{3}{4}$ lb; a quart about $1\frac{1}{2}$ lbs. Those varieties marked (S) weigh about 10 lbs to the peck or about 40 lbs to the bushel. Those not so marked weigh 14 lbs to the peck and 56 lbs to the bushel. It is very largely on account of these differences that we quote by the pound.

CULTURE—For an early crop in the Charleston section, plant in March. Rows should be $2\frac{1}{2}$ to 3 feet apart. The early maturing short varieties do not require as much space either between the rows or the hills as the later sorts. Hills should be 2 to $2\frac{1}{2}$ feet apart on the row, and the plants should be thinned out to two stalks. One pound plants 100 hills; 10 to 15 pounds to the acre.

Stowell's Evergreen (S) A late maturing variety, standard and well known. Grain is deep, tender, and well flavored. Ear is good sized.

Country Gentleman (S) A true Sugar Corn, with shoe peg kernels, irregularly set. Grains are deep, very tender, and very compactly placed on the cob. Very prolific, bearing several ears to the stalk, and ears are good sized.

The order of maturity of these varieties is Golden Bantam, Early Adams, Truckers' Favorite, Stowell's Evergreen, Country Gentleman, Improved Snowflake.

Pop Corn

White Rice Generally regarded as the most popular variety, either for popping or for green feeding for which purpose it is very largely used. Grains are pointed, pure white, and while ears are small, several of them are borne to the stalk.

Golden Queen The best variety of Yellow Pop Corn, but on popping the yellowness disappears, and it pops pure white. The ears are very pretty.

MIXSON'S CUCUMBERS FOR TRUCKERS

CULTURE—In the Charleston section, Cucumbers for the earliest market are planted in March in rows, 5 feet apart, and in hills 3 to 4 feet apart on the row. After all danger of frost is over, they are thinned out to two plants to the hill. One ounce will plant 50 hills and 2 pounds will plant an acre, but in order to have early Cucumbers, the common practice is to always have an extra planting in the ground. This second planting is made as soon as the first one shows up, so that if frost takes the first sowing, the second will be already started to take its place. The price of the seed is very small compared with the desirability of having them early.

Mixson's Special White Spine Several years ago it seemed evident to us that the popular varieties of White Spine types were losing both in length and color. Between our grower and ourselves we have been able to develop this White Spine variety which we consider superior to anything in its line. It is very early, wonderfully uniform in shape, with practically no culls, the color being a deep, dark green which it retains long after pulling. This makes it a most desirable shipping variety. Flesh is firm and size and shape make it ideal for slicing. In our opinion it is the most truly bred of all the white spine types and we recommend it most highly to critical truck farmers.

Stays Green A variety of comparatively recent introduction which is very popular in some shipping sections. It retains its deep green color long after shipping. Size and shape are good. We have the true stock of this variety.

Early Fortune A most desirable variety for truckers. Early, dark green, very symmetrical, bringing the top of the market. We have a strain of this variety that is unsurpassed.

Arlington White Spine A well known standard variety, still popular with some truckers, though very largely supplanted now by our Mixson's Special White Spine. We have, however, retained all the characteristics of the old type, and offer a true and well selected stock.

OTHER STANDARD VARIETIES are also listed and quoted below. Most of them are well known to the trade and to home gardeners, and our stock of each of them represents the very best that can be grown.

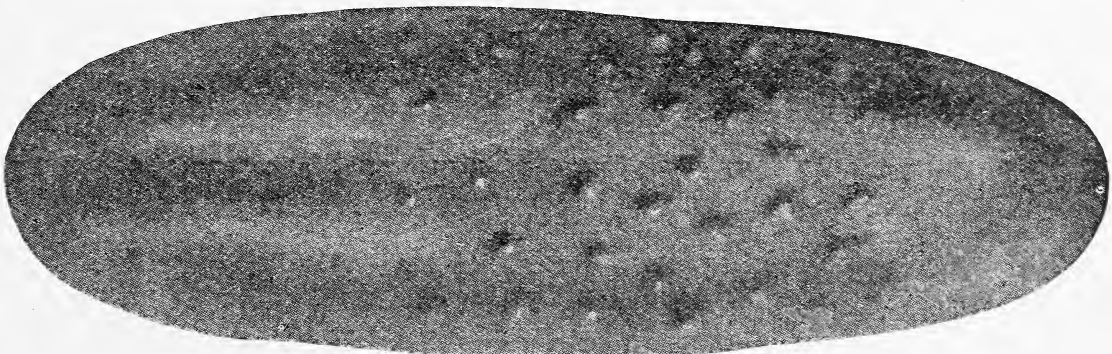

Celery

CULTURE—One ounce is needed for 100 feet of drill; 4 ounces should produce enough plants for an acre.

Golden Self Blanching We have a very select French strain of this well known variety. It does not require as much work in blanching as other varieties do. It makes a compact, dwarf, uniform growth, the heart being firm, of excellent quality and of a rich golden color. To celery growers, we can unhesitatingly recommend this stock of ours as being very select.

Mixson's Special White Spine Cucumber

EGG PLANT

Black Beauty Egg Plant

CULTURE—Egg Plant seed are very hard to germinate, requiring more heat than most other seeds; so that it is usual to plant them for early plants in a hot bed. For an early crop, sow in this way in February and transplant to open ground when danger of frost is over; have the rows four feet wide with the plants three feet apart on the row. One ounce should produce five hundred plants of the proper setting size, and one-half pound of seed is usually sown for each acre that is to be planted.

N. Y. Improved Purple A standard variety and the most popular for early shipping. The fruits are of a glossy, dark purple color, and very symmetrical in shape. Plants are very thrifty and productive. It is the variety most commonly used throughout the South.

Black Beauty Probably a little earlier in maturing than the New York Improved Purple, and for this reason it is often used where earliness is especially desired. The fruits are large, deep purple, almost black, in coloring is very uniform over the entire fruit. We offer a strain of this that is especially well selected.

Mixson's Spineless An unusually smooth and well selected stock of Eggplant. It matures with New York Improved Purple and the fruits are exceptionally large and richly colored.

Florida High Bush This variety has proved of great benefit to the truckers in the South. It grows taller than the other varieties listed, producing large oblong fruit of a deep purple color. It is very vigorous and productive. It will mature a few days later than New York Improved. The plant carries its fruit well above the ground. This variety is very largely used in Florida, and the stock that we offer is especially selected for this critical trade.

Kale

CULTURE—One ounce will sow 150 feet of drill, or about two pounds to the acre. Cultivation is very much the same as for Cabbage.

Early Dwarf Green Curled Scotch

The leaves are a dark bluish green, and are very attractive. The plant is very dwarf and spreading and on account of its hardiness it is a standard variety.

Green Curled Siberian Hardy, very productive with very large green leaves, very much curled, especially on the edges.

	Packet	Oz.	1/4 lb	1 lb	5 lbs	10 lbs
Early Dwarf Green						
Curled Scotch	.05	.15	.35	1.00	.90	8.50

Kohl Rabi

CULTURE—Sow in rows 18 inches to 2 feet apart, thinning out to leave the plants 6 inches apart. One ounce will plant 100 feet; 2 pounds to the acre.

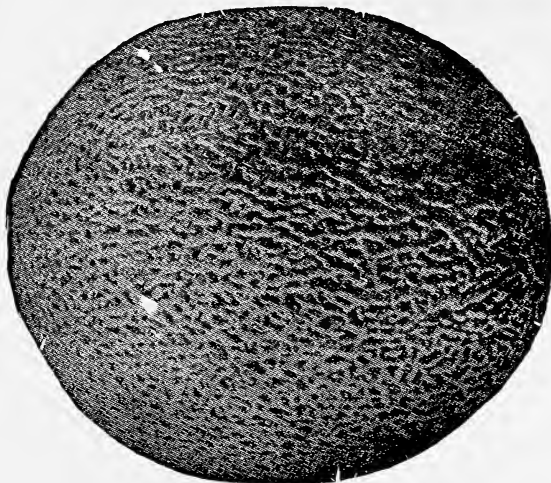

Early White Vienna The best variety and the one most commonly used. Packet, 10c; Oz., 25c; 1/4 lb, 75c; 1 lb, \$2.50 postpaid. Charges collect—1 lb, \$2.40; 5 lbs, \$11.25.

Leek

CULTURE—Sow first in a seed bed, and after the plants are 6 inches high, transplant to rows 1 to 1 1/2 feet apart, with plants six inches apart in the row. Set deeply, so as to blanch.

Large American Flag A strong growing variety, with large, thick stems, very tender. Packet, 10c; Oz., 20c; 1/4 lb, 65c; 1 lb, \$2.25, postpaid. Charges collect—1 lb, \$2.15; 5 lbs, \$10.00.

CANTALOUPE OR MUSKMELON

Mixson's Special Rocky Ford Cantaloupe

CULTURE—One ounce will plant 50 hills; one and a half pounds is needed to plant an acre once, but as with cucumbers, in order to get a very early crop a second planting is put in just after the first planting appears, and for this reason a double supply of seed is usually bought. Of course, if planting is done after all danger of frost is over this second planting should not be necessary. Method of planting and cultivation is very much the same as for cucumbers.

Mixson's Special Rocky Ford This splendid variety has all of the good traits of this old popular sort but with many improvements, being much more highly bred than the usual stocks of Rocky Ford commonly offered. It is slightly oval-shaped with thick green flesh, very firm, and lined with gold. The seed cavity is very small which makes it an excellent shipping melon. The outer skin is heavily netted, without ribs.

Rocky Ford This is the regular strain usually offered by responsible growers, and it maintains all of the very excellent characteristics of this well known standard variety. Most of our trade, however, prefers to pay the slight extra charge and get the special strain.

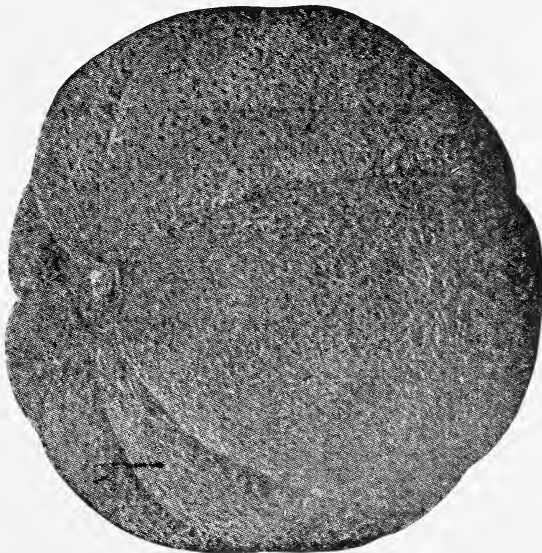

Pollock 10-25 This is a salmon flesh variety and is sometimes known as the salmon-fleshed Rocky Ford, because it has all of the general characteristics of Rocky Ford except that its flesh is salmon instead of green. It is very tender, without strings and is an excellent shipper.

Hackensack The fruits are large, nearly round, but flattened at the ends. It is not as early as most of the other varieties and for this reason is not recommended for a very early crop, but its size together with its quality makes it very desirable, either for home market or for nearby market. The flesh is green and it has a heavy netting with prominent ribs.

Honey Dew We offer the green fleshed type. It is remarkably sweet, flesh is very thick and fine grained. The rind is perfectly smooth, of a light green color, changing to a light yellow when ripe, and before eating it must be fully matured to get the full benefit of taste.

Hanover A very early variety, maturing ahead of Rocky Ford with a number of excellent qualities. Its size is fairly large, flesh is green and thick. The skin is heavily netted with slight ribs. The size is oval, slightly flattened at the ends.

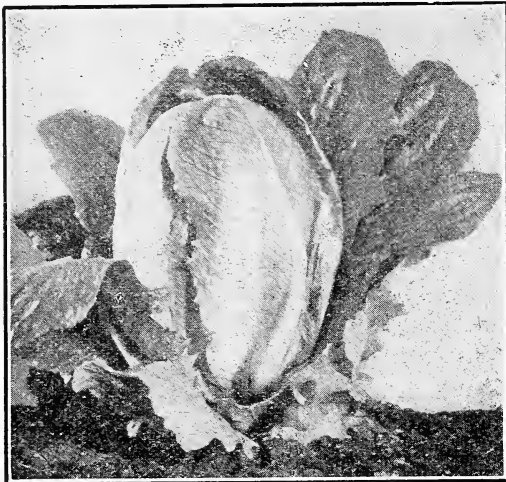

OTHER STANDARD VARIETIES are listed and quoted below in our price list of Cantaloupes. All of them are standard varieties, grown in a most careful manner, and will please the most critical trade.

LETTUCE

Special White Paris Cos

Iceberg A curled and crisp heading variety, medium large and medium green, with leaves wavy with fringed edges, tinged at margins with brown. Forms a compact, crumpled head very white and crisp inside.

Mixson's Special White Paris Cos

Our strain of this represents a very close selection of this variety which is the standard and most popular of the Cos and Romaine varieties. Is medium large, medium green, and forms a well folded head of extra fine quality. This variety is synonymous with Frianon Cos. The inner leaves blanch to a beautiful white, of good flavor.

White Paris Cos (Reg.) .10	.15	.45	1.60	1.50	14.00	

CULTURE—One ounce should give 3,000 plants and eight to ten ounces, enough plants for an acre, but most of the best truckers buy at the rate of 1 to 2 pounds of seed for each acre to be set out. This, of course, will give them more than is actually needed, but they do this in order to have plants just exactly the right size. In this latitude, seed for Spring heading is sown in beds in October, and transplanted in the first part of January. When sown in the field and thinned out, 1 ounce is needed for 150 feet.

Mixson's Special Big Boston

This is the very best selection that we can get from this well known variety. It is a cabbage-head, butter type, early, fairly large, globe shaped, medium light green, with a slight tinge of brown on the margins of the outer leaves. The leaf is smooth, and the inner leaves are brittle, buttery, and of a golden yellow color. This strain of Big Boston is offered to a critical trade with full confidence.

Big Boston

For many years the standard variety planted in the South. Our regular strain is the same as the Big Boston put out by many other responsible Seedsmen, and is the parent stock of Special strain.

Unrivalled or Improved Big Boston

Practically identical with Big Boston, except that it lacks the brown tinge on outer leaves, and for this fact is preferred by many.

New York or Wonderful

Is also known as Los Angeles Market. A curled or crisp heading variety, dark green and slightly curved on the edges. The head is flattish globular, and the outer leaves fold over the head very closely. This is the variety used extensively in the Lettuce section of California, and marketed as Imperial Valley Iceberg, which fact accounts for some growers calling for this variety under the name of Iceberg, but Iceberg is a distinct type.

Okra

CULTURE—One ounce sows 50 feet of drill; 10 pounds to the acre. Rows should be three feet apart, the plants being thinned out to 8 to 10 inches on the row.

Improved White Velvet

The best of the white podded sorts. Early, round, free from ridges, and smooth. It is the most popular variety grown in the Charleston section.

Perkins' Mammoth

A very tall growing variety, producing pods from the ground up, and therefore very productive, being very largely used for shipping and canning. Pods are nine inches long and over, very green, and tender.

Dwarf Green Prolific

Grows very dwarf, but producing an immense quantity of green pods, but shorter than Perkins'. It is, however, earlier than Perkins' and by some it is preferred on account of its very dwarf habit.

Mustard

CULTURE—Sow 2 ounces for 100 feet of drill, or 3 pounds to the acre.

Southern Giant Curled

The most popular and dependable Southern variety. Makes an abundance of finely curled, very green leaves of excellent quality. Packet, 5c; ounce, 10c; ¼ lb, 25c; 1 lb, 75c; postpaid. Charges collect—1 lb, 65c; 5 lbs, \$6.00.

SPINACH

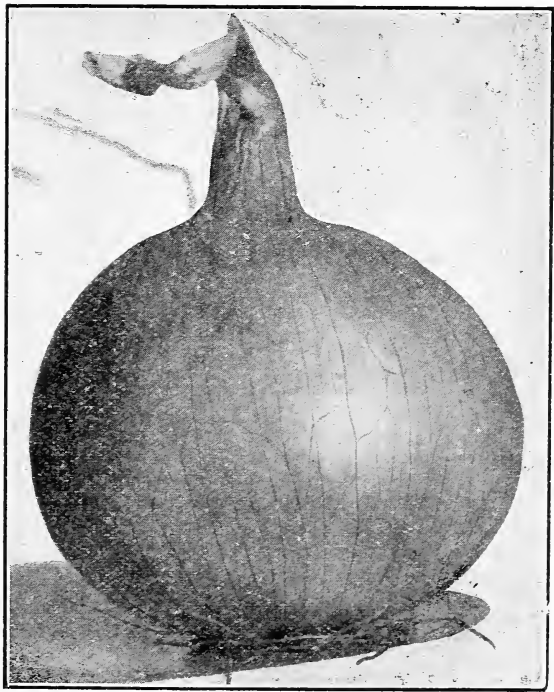

CULTURE—Can be planted in rows 1½ to 2 feet apart taking 12 to 15 pounds to the acre. Is also planted on wide beds, four rows to the bed, taking about 30 pounds of seed. In the Charleston section, it is usually sown for market during October. Spinach seed is very hard to germinate—especially during very warm weather.

Bloomsdale Curled Savoy This is the variety most commonly used by Southern truckers, but we offer a strain that is much superior to the stock usually put out. It has a vitality and vigor that many others do not possess. The leaves are very dark green, crimped just right, very crisp, and is a big yielder.

Bloomsdale Curled Savoy (Blight Proof) For years growers of Spinach have been wanting a strain of this kind, and this work has been done at the Virginia Experiment Station. This strain is recommended, therefore, to growers who are liable to be troubled with blight or yellows.

TRUCKERS using Spinach in large quantities are asked to write us for our quantity prices. We supply many of the very largest Southern Spinach growers, and not only are our prices attractive, but our strains are well known for their trueness to type and large yield.

Prizetaker Onion

Onion

CULTURE—Sow in 18-inch rows, thinning out to three inches between the plants on the row. Keep the ground free from weeds, but do not disturb the growing bulbs. One ounce will plant 100 feet of drill; five pounds is needed for an acre. If Onion Sets are planted a quicker crop can be obtained. One quart equals about a pound; 8 pounds, a peck; 32 pounds, a bushel. A quart of average size sets is needed for 100 feet, or 10 bushels to the acre.

Bermuda Varieties

For earliness, flavor, and all-round general good qualities, these sorts are generally preferred throughout the South. The Yellow is the best known, being most generally planted, the color being a light straw, the quality excellent, and it is a good yielder. This is the variety so muchly used in Texas. The Crystal Wax is a pure waxy white, exceedingly tender and handsome when fully matured. The Yellow is very often still called White, and our customers are asked please to indicate definitely which variety they want. Our seed is grown in the Canary Islands, and we refuse to handle stock of these varieties of any other growing.

OTHER STANDARD VARIETIES are also listed. They are American grown, from the very best seed stocks.

ONION SEED is handled by us in very large quantities, and we are prepared at all times to quote very lowest prices to quantity buyers. When writing, please state variety and quantity wanted.

Salsify

CULTURE—Sow early in the Spring in drills, 18 inches apart, thinning out to 5 to 6 inches between the plants. Sow 1 ounce to 50 feet of drill, or 10 pounds to the acre.

Mammoth Sandwich Island Packet, 10c; O z., 25c; ¼ lb, 75c; lb, \$2.50, postpaid. Charges collect, lb, \$2.40; 5 lb, \$11.25.

GARDEN OR ENGLISH PEAS

Thomas Laxton Peas

CULTURE—In the Charleston section the medium early wrinkled varieties are planted the last of December or the first half of January, one and a half to two bushels to the acre. The smooth, or extra early types are usually sown during January or the first part of February one to one and a half bushels to the acre. One quart will plant 100 feet of drill. Smooth varieties weigh 60 pounds to the bushel, 15 pounds to the peck, and about two pounds to the quart. Wrinkled varieties are 56 pounds to the bushel, 14 pounds to the peck, and nearly two pounds to the quart. Wrinkled varieties are indicated by a (W). Wrinkled varieties are more affected by cold and bad weather. A fall crop can also be planted, sowings being made in the Charleston section about September 1st.

Thomas Laxton (W) The variety most generally used by southern truckers. It is early, being only slightly later than the Extra Early smooth sorts, pods are long, very often four inches, and containing seven to eight peas. Vines are about three feet, very hardy, productive, and the peas are of excellent quality. Our strain has dark green pods and is especially recommended for a market garden trade.

Laxtonian (W) The vines are very dwarf, only about 18 inches high, but are extremely productive and as large or a larger crop can be obtained than from many of the larger vined varieties. Pods are long, averaging four inches, and the quality is unsurpassed. There seems to be several different strains of Laxtonian, but after numerous trials we have adopted a strain with a very dark, heavy vigorous vine, with extra dark green pods. Stock of seed this year is very short.

Early Alaska One of the standard and popular extra early maturing, smooth peas. Vines are dwarf, very productive, though they are not large. It is very largely used for canning, especially in the North, although many truckers grow it on account of its extreme earliness and hardiness.

Ameer or Large Alaska A large type strain of Early Alaska, possessing the same general characteristics except that the bush is larger, some later, and pods are also larger.

Tall Telephone (W) A late maturing sort, with vines about four feet and for best results, therefore, it should be staked, or planted in double rows as is sometimes done. The pods are unusually long and well filled. In order to mature with the early sorts it should be planted two to three weeks in advance.

Early Bird A comparatively recent introduction of real merit. Vines average two and a half feet, early, with long, dark green pods. This is not a true wrinkled variety, the seed being only semi-wrinkled, and for this reason it is somewhat hardier than the wrinkled types.

PEPPER

CULTIVATION—Sow in hot bed, in February, transplanting to open ground after danger of frost. Rows should be two and a half feet apart with about 18 inches between the plants on the row. Plantings can also be made in the field, and the plants thinned out after they are well up. One ounce will produce about one thousand good plants, and from eight ounces to one pound of seed is usually bought to grow plants for an acre.

Mixson's Crimson Giant An especially well selected stock, of the large, scarlet type. Flesh is unusually firm, and shape is very symmetrical, and mild flavored. We recommend this very highly as a shipping sort.

Ruby Giant or World Beater This is a cross between Chinese Giant and Ruby King, retaining the shape of the Ruby King, and combining with it the size of the Chinese Giant. Furthermore, it is just as early as Ruby King, and to our mind is therefore an improvement on this well known standard variety. Very mild, symmetrical, and a good shipping variety.

Ruby King Still used in a number of trucking sections. It is a splendid early pepper, large, although it has not quite the size of Ruby Giant. Very productive and mild flavored.

Chinese Giant A very large fruiting variety, in fact, the largest in our list, but the shape is apt to be somewhat irregular. When matured it is a brilliant scarlet, very mild, tender and brittle. It is rather late.

Bell or Bull Nose Although the other varieties listed above have very largely superseded Bell in most trucking sections, it is still used by some. Our strain is mild flavored, early, and is large size.

Long Red Cayenne A red variety very hot, and therefore only used for seasoning.

Pimiento An unusually thick flesh sort. The fruit is conical in shape, symmetrical, of a bright scarlet color, very tender, and sweet. It is the variety most commonly used by canners, and our stock will be found thoroughly dependable for this purpose.

Parsley

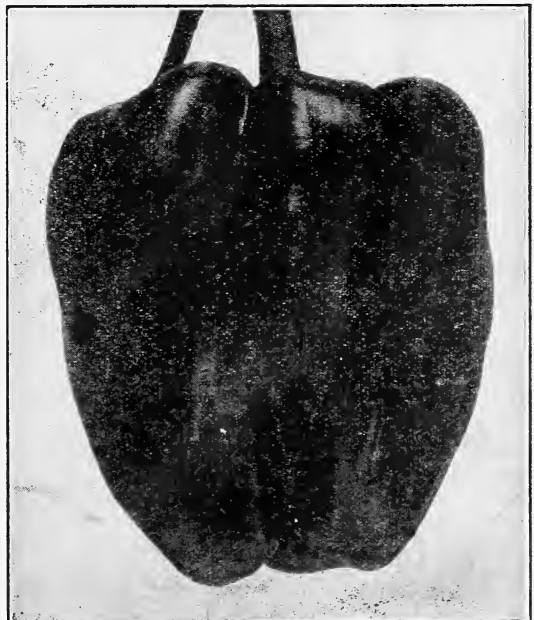

CULTURE—Sow the seed in rows 1 ft. apart, thinning out to about 6 inches between the plants. One ounce will sow 100 feet; 6 pounds is needed for an acre.

Champion Moss Curled Tender, beautiful, fully curled leaves, of a deep green color. Packet, 10c; Oz., 15c; ½ lb, 30c; lb, \$1.00, postpaid. Charges collect, lb, 90c; 5 lb, \$4.25.

Parsnip

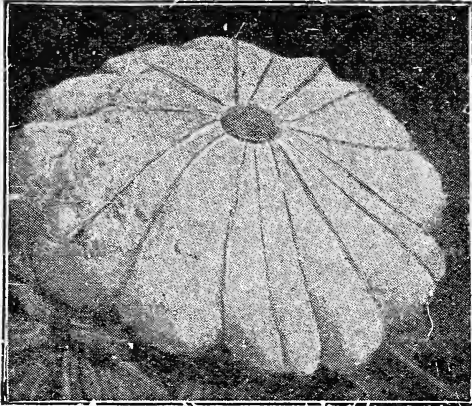

CULTURE—Sow in rows 15 inches apart, thinning out to 4 inches. 1 Oz. plants 100 feet; use 5 to 6 lb to the acre.

Selected Hollow Crown Packet, 10c; Oz., 15c; ¼ lb, 35; lb, \$1.00, postpaid. Charges collect, lb, 90c; 5 lb, \$4.25.

Mixson's Crimson Giant Pepper

SQUASH

Early White Bush Squash

CULTURE—One ounce is sufficient for 100 feet or 40 hills. Three to four pounds are usually planted to the acre. General cultivation and method of planting is very much the same as for Cucumbers. Planting is made in hills and after well up, and all danger of frost is over, the plants not wanted are pulled out.

Early White Bush Commonly known as Patty Pan. Very early, smooth, and showing the well known Patty Pan shape. The fruits are very thick, tender, and are of the best quality; waxy-white, and plants are very productive.

Yellow Bush Is practically identical with White Bush except that the skin and flesh is yellow. It grows to a good size, the edges are scalloped, and it is very early.

Early Yellow Crookneck An extremely early strain of this well-known type. Smaller than the Mammoth, but on account of its earliness is generally preferred by truckers.

Cocozelle This is a bush variety, sometimes known as Italian Squash and very popular in some Northern markets. Fruits grow very long, very often twelve inches. The color is dark green, mottled with lighter green, and the flesh is extremely tender. The shape is long, averaging four inches in diameter.

Hubbard One of the very best winter varieties. Flesh is bright orange, fine grained, and of a good flavor.

Boston Marrow A standard winter variety. Oval-shaped and yellow-skinned.

Mammoth Yellow Summer Crookneck Much larger than the Early Yellow listed above, but later. Skin is bright yellow, covered with warts.

Radish

CULTURE—One ounce will sow 100 feet of drill, and eight pounds one acre. The largest truck farmers, however, sow Radish broadcast, or broadcasted on wide beds, taking about 30 pounds to the acre.

Mixson's Special Early Scarlet Globe An unsurpassed strain for truck farmers, especially selected for uniformity, color, and size. Very early, it makes a globe-shaped radish, of bright red color, smooth skinned and very attractive. Bunches well. Very largely used by many of our largest truckers.

Scarlet Turnip The best of the turnip shaped varieties, early red, very uniform, and of uniform tender quality.

Scarlet Turnip White Tip The best market garden variety of the white-tipped sorts. Bright red, with the extreme end and tail white. We have an early and well selected stock.

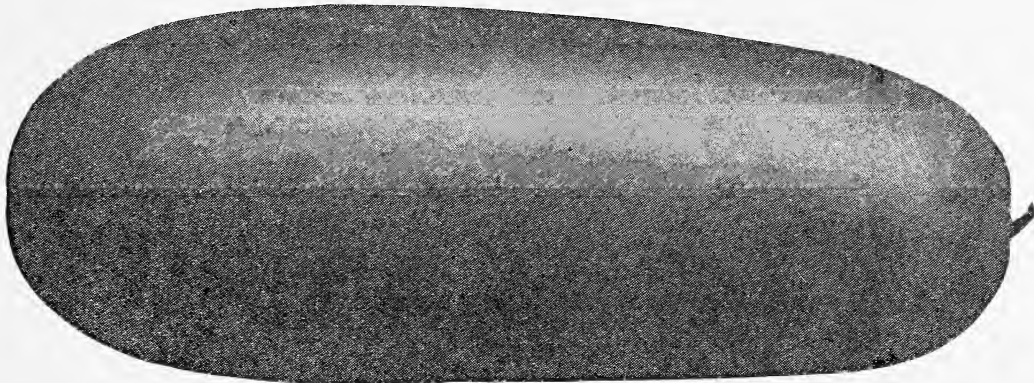

Early Long Scarlet A long, bright red variety, very tender and brittle, smooth and tender. Our strain of this variety is identical with Cincinnati Market.

OTHER STANDARD VARIETIES are also listed below. Many of them are well known sorts, needing no description, and our stocks can be depended on as being uniform, producing radish of good quality.

MIXSON'S SEEDS are used by some of the largest and most successful Southern Truckers. Our strains are thoroughly dependable, and we aim to make our service satisfactory. Whether you plant a large acreage or a back yard garden, Mixson's Seed will please you.

WATERMELON

Tom Watson Melon

CULTURE—Usually planted in hills, eight feet apart each way. Light, but rich and well drained soil is best adapted. Usually eight seed are planted to a hill, and when well up, thinning out to the three strongest. One ounce is needed for 30 hills and four pounds for one acre.

Irish Gray Our strain is grown especially for growers of melons for market. Melons are large and long, rind is a mottled grayish green, flesh is very red, tender, sweet, without stringiness. Rind is tough enough for long distance shipping, and in many sections is taking the place so long held by Tom Watson.

Tom Watson Long known as the best shipping melon. Melons are long, large, dark green, with a very tough rind; flesh is a rich red color. Our seed is well selected from first class melons only, all of which show the proper characteristics.

Kleckley Sweet Rind is rather thin, and for this reason is not recommended for very long distance

shipping, but for home use and for nearby markets, it is very excellent. It is long, early, dark green, but extra good quality red flesh.

Florida Favorite Does not grow quite as large as some of the other varieties, but it has many good qualities which makes it very popular. Rind is fairly thin, and flesh is of the very finest texture. Shape is oblong, and rind is dark green, with lighter green stripes.

OTHER STANDARD SORTS are also listed and quoted below. Most of them are well known varieties that need no description, and the stocks we offer can be depended on as uniform, true to type, and sure to please the most critical trade.

Ruta Baga

CULTURE—Plant in rows, 2½ feet apart, the seed being drilled at the rate of about 3 pounds to the acre, or one ounce for 100 feet of row. When well up and growing, they should be thinned out. The same cultivation applies to Turnips.

Mixson's Purple Top Yellow

There are many strains of Ruta Baga, some of which are not at all adapted for planting in the South. We have an extra selected strain, selected from roots chosen for uniformity of shape and color, as well as size, and without neck.

TOMATOES

Mixson's Earliest of All Tomatoes

CULTURE—For early crops, seed should be sown in hot bed, and plants set out in open field after danger of frost. Rows should be three feet apart and plants the same distance apart on the row. One ounce gives about 1,500 plants, and 4 ounces should grow enough plants for an acre, but as a rule more is planted so as to have a better selection of plants when setting out time comes. For later crops, seed is very often "spotted" in the field where they are to grow, and thinned out later. When planted this way more seed will be required than when transplanting. Regular spraying with Bordeaux Mixture helps prevent blight.

Mixson's Earliest of All

This variety is exclusively our own introduction, and from no other source can the genuine seed be obtained. After numerous trials and experiments, we put it on the market ten years ago, and it met with immediate success. It continues to please many critical customers scattered over the country as is shown by hundreds of voluntary testimonials from growers of this remarkable variety. Whether you are planting, therefore, for shipping purposes, or for home garden purposes, we are sure that **MIXSON'S EARLIEST OFF ALL** will please you.

To begin with, it is extra early in maturity, in fact it is the earliest pink skin variety we have ever seen. This is, of course, of advantage to shippers for early market. At the same time, it has a long bearing season, which makes it desirable for home gardeners. The skin is pinkish, the flesh is very firm, of good quality, and it ripens clear to the stem end, being unusually free from cracks. It is an excellent shipper, and slices to good advantage. The vines are very thrifty and sturdy, and very large yields have been made with this variety.

Pink Skin Varieties

Select Livingston's Globe Practically every seersman lists this variety, but the stock that we have is selected especially for a market garden trade, and we are sure will please the most critical. It is a well-known standard shipping short, and stands at the head of its class in this regard. The fruits are globe-shaped, pinkish, and the flesh is very firm. It is a good slicer and stands shipping unusually well. It is medium early in maturing.

Improved Ponderosa Distinctly a home garden variety, as its extra large size makes it desirable for shipping. It is one of the largest tomatoes grown. The flesh is very firm and with very few seeds, which makes it desirable for slicing.

Early Detroit A very dependable, medium early variety, with solid fruit. Skin is pinkish purple. Unusually resistant to blight; very hardy, and productive. As a home garden variety with which to follow Mixson's Earliest of All, we know of no better.

Cooper's Special This variety is used extensively by Southern truckers, principally in Florida, and it is to this trade that we offer with confidence our select strain of this variety. It is slightly earlier in maturing than Livingston Globe, with a somewhat dwarfier bush. It is a very vigorous grower, and the fruits are globe-shaped and pinkish, with firm flesh. This makes it very desirable as a shipping variety. It is unusually free from cracks; ripening to the stem end, which makes it naturally very desirable on the market.

Red Skin Varieties

Chalks Early Jewel A standard variety, very dependable and extensively used both for trucking and home gardens. It is medium early, with deep scarlet fruit borne on vigorous vines, and with long producing reason. It is a good yielder, and on account of its splendid quality and size is very prolific.

Brimmer This is one of the largest tomatoes grown, and very heavy yields have been gotten from the use of this variety. It is medium early, the vines are very vigorous and continue to bear during the entire season. The fruit is red, very solid and meaty, and has very few seeds. The quality and flavor is the very best. On account of its size it is very popular as a shipping sort, but we recommend it especially as a home garden variety.

New Stone This variety is without doubt the most popular of the red fruit varieties, especially for the main crop. As a canning sort, it has no superior. On account of the very wide use of this variety there are any number of stocks of Stone, but what we offer is very closely selected for color, shape, and general uniformity, and is superior to any other stock of Stone that we have seen. It is late in maturing, with bright red fruit, firm flesh, and ripening evenly.

Bonny Best This is a well known standard variety which has been in use for many years, and which continues to have many good points. Our strain is well selected for earliness and trueness. It is a vigorous grower with bright red fruits, very solid, and ripening to the stem end.

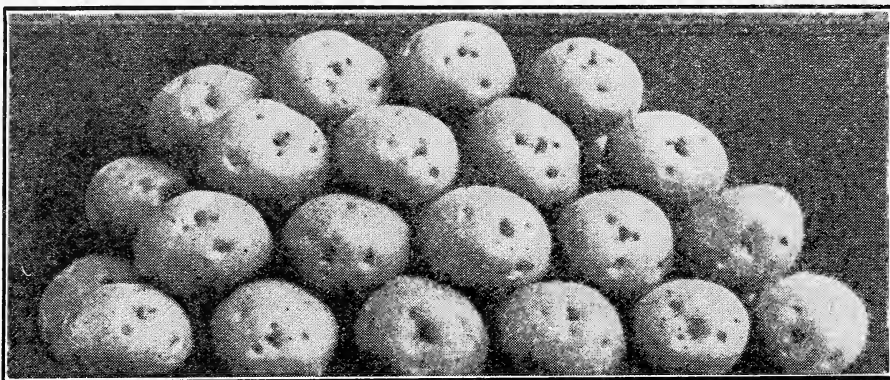

Earliana This is the earliest of the red skin sorts, and is still planted by some of our best truckers. The skin is bright red and it has medium sized smooth fruits. Our stock of this well known variety is very closely selected, and can be used with confidence.

Florida Special Very popular with a number of Florida truck growers and the strain that we offer is selected especially to meet the demands of this critical trade. The skin is very red, with firm flesh, and it is an extra good shipper. It is good sized, and very prolific. It matures right after Earliana, and is therefore classed as a medium early variety.

OTHER STANDARD VARIETIES of both Pink Skin and Red Skin sorts are listed below. Those described above are our most popular shipping varieties, but all are grown with the same care, from selected stocks, and will please the most critical trade. You can use them without any hesitation.

SEED POTATOES

Irish Cobbler Potatoes

Our stocks are all grown in Maine from the very best selected seed stock, in sections best suited to their proper production. They are rigidly inspected and rogued while growing, carefully isolated one variety from the other to prevent mixture, painstakingly harvested and stored, and then after all this they are again closely inspected on their arrival in Charleston. We say without hesitation that our seed Potatoes are as near perfect as it is humanly possible to get them.

There are, of course, stocks of Potatoes that can, no doubt, be bought cheaper than ours. Our potatoes appeal only to the critical buyer—the man who wants true stock, free from disease, and to the man who knows that any slight difference in price is very often more than made up for at harvest time.

Certified Irish Cobbler The very best stock of Cobblers is it possible for us to buy. Grown by one of the best growers in Maine, and every bag bearing the certification tag. Our stock is roundish, white, with well developed eye lid over the eyes, average size that cut to good advantage. Very early.

Early Norther Rose Slightly earlier than the standard Rose or Spalding's Rose No. 4. However, it is later with a larger bush than Cobbler. Shape is oblong, inclined to be flattish, with good eyes. An extra good yielder, with long roots which allows it to stand dry weather better than Cobbler.

Early Rose An Early Rose potato, oblong, and a standard variety. Early Norther Rose is, however, a better strain, having all the best traits of this sort, besides being better selected.

FOR POTATO BUGS we recommend the use of Dry Powdered Arsenate of Lead. It can be applied either dry as a dust or as a spray. It is effective and economical. If a tonic for the vines is wanted use Dry Powdered Bordeaux Mixture. Both can be applied together or separately. See page 27. Large Truckers or Associations should get our prices.

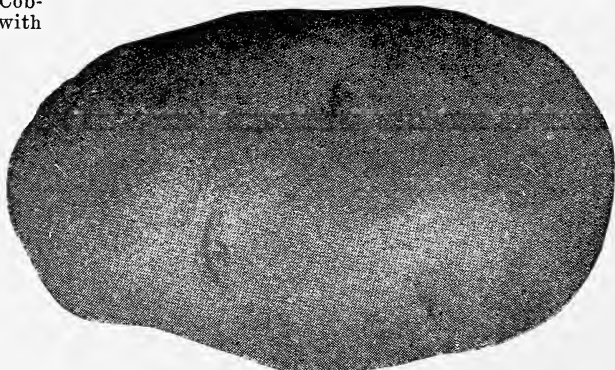

Green Mountain A late maturing variety of white Potato. Large bush and a heavy yielder.

Red Bliss Triumph The standard red skinned Potato. Very early, with generally speaking the same shape and characteristics as Irish Cobbler.

Spalding' Rose No. 4 A large, late maturing strain of the Rose type. Very heavy yielder. Potatoes are long, flattish, with very often an indentation on one of the sides. Not advisable for use for the very earliest market.

PRICES QUOTED BELOW are those ruling when this Catalog goes to press. The Potato market is, however, very fluctuating, and we are always glad to give firm prices at any time. Large buyers especially should write us, stating approximate quantity wanted. We have a very large Truck Farming trade, and will always give our lowest prices, consistent, of course, with our high quality stocks.

Mixson's Early Norther Rose Potato

FIELD SEED DEPARTMENT

Permanent Pastures for Spring Sowing

The time was, and it has not been so very long ago, that any old piece of land, that wasn't of use for any other purpose, and that would not grow anything, was allowed to grow up in "grass", and was called "the pasture." It has, however, been learned that in order for the pasture to be profitable, it must be well located and drained, that it must be well prepared and sown in certain grasses. During the past few years, tremendous strides have been made in this direction in the South, until now, well-prepared and excellent pastures are very numerous.

For this purpose, it is advisable to sow several grasses in combination. This affords grazing over a longer period than if only one were planted, as one comes on after the other has reached its best. In most sections of the South a combination of 10 lbs Lespedeza, 6 lbs Carpet Grass, and 5 lbs Dallis Grass work well, though this is subject to change under certain conditions and in certain sections. We list below several of the most valuable.

Carpet Grass

This grass reaches its perfection on light and sandy soils of the Coastal Plain. It is a perennial that spreads by creeping stems that root at every joint, forming a dense compact sod. It will stand severe trampling better than any other grass, in fact the more it is trampled, the more it spreads. It is entirely a pasture grass, not being adapted to hay. It does not have under-ground roots like Bermuda, and therefore can easily be eradicated. Does not like shade. When used alone, sow 12 lbs to the acre.

Bermuda Grass

This is the very best foundation for pastures in the South, especially on clayey soils. Its habit of growth is well-known, and it will stand either extended droughts, or overflows. On rich lands or in bottoms, it will make a growth large enough for cutting for hay, but its principle value is as a pasture grass. The seed should be sown after the ground is warm. For lands liable to wash, for embankments, and for terraces, Bermuda is without an equal, as the matted roots hold the soil firmly in place. It germinates very slowly, and ground should be extra well prepared, the seed covered very lightly, and firmly rolled. When sown alone, use 12 lbs to the acre.

Lespedeza

A legume, and therefore needs lime for its best development. It works well in a combination, furnishing excellent grazing during the summer and early fall, and the feeding value is very close to that of Alfalfa. It does well in a pasture on thin or sandy lands, but on better lands it very often makes a good hay crop. The stems are very slender and the quality is good. When sown alone use 20 to 25 lbs to the acre.

Dallis Grass

Grows best on fairly heavy and somewhat moist soils, and for this reason, on very sandy soils, Dallis Grass is often left out of combinations. It makes a continuous growth during the summer, and is not injured by close grazing, and also seems to stand moderate frost, affording, therefore, a long grazing period. It does not spread from runners, but grows in clumps. When the clumps are very close together, the growth will be more erect than when far apart, and then it is sometimes grown for hay, but its principal value is for pasture. When sown alone, use 10 lbs to the acre.

White Dutch Clover

This clover works well in a mixture with other clovers or grasses throughout the central South. It makes a close, compact growth, covering the ground. It generally prefers a fairly heavy soil, not too dry, and in fact does its best in wet seasons. Not adapted for hay, but pasturage only. Sow 8 lbs. to the acre alone, or 4 lbs. when in combination.

Peanuts

FIELD SEED DEPARTMENT

All seed listed in this department is high grade stock, from selected crops, carefully harvested, well cleaned, and put up in strong bags. We have excellent cleaning facilities which enables us to do this well. No charge is made for burlap bags, but in the case of Clovers and some high-priced Grasses, cotton seamless bags are used, and these are charged extra and are non-returnable. Quotations on all Field Seeds are very variable and it is impossible to quote prices which will hold good the entire season. These are the prices ruling when this Catalog goes to press, and it is never our policy to change prices needlessly, but some may be necessary. Write or wire us for firm quotations at any time, stating quantity wanted, and we will gladly supply them.

Seed Oats for Spring Sowing

Burt or 90 Day Very popular for Spring sowing. A quick maturing variety, makes a good growth of straw, and particularly adapted to late sowings. Peck, 40c; bushel, \$1.00; 10 bushels, \$9.50.

Fulghum Generally considered now the best variety for general planting in the South. Grows a good stiff straw, with large heads, with big, plump grains. Peck, 45c; bushel, \$1.10; 10 bushels, \$9.50.

Texas Red Rust Proof Peck, 40c; bushel, \$1; 10 bu., \$9.50.

Millets, Cane Seed, Sudan Grass, Etc.

These are very largely used for green cutting, and, if planted early, two crops may be secured in one season. Of the Sorghums, Amber is the earliest, and Orange is the largest producer. Sugar Drip is recommended for syrup production. Use 1 to 1½ bushels to the acre broadcast, or 6 lbs to the acre in 3½ foot rows.

Pearl Millet is a very excellent green feed. Cut when about 4 feet high it will stool out and grow again. Sow 6 lbs to the acre in 3-foot drills. German Millet is used only for hay, doing well on rich land, and taking 1 to 1½ bushels to the acre broadcast. Sudan Grass makes very excellent green feed, or hay, planted 20 lbs to the acre broadcast, or 6 lbs to the acre in 2-foot rows.

German Millet

Soy or Soja Beans

As is commonly known, the price of Soy Beans fluctuates, and this far ahead it is impossible to quote prices which will be firm during planting season. Please, therefore, write us, giving us quantity and variety wanted, and we will give you our very lowest prices. We will also be in position to quote all varieties of Velvet Beans and Cow Peas.

FIELD SEED DEPARTMENT

(Continued)

The Standard Inoculation For All Legumes

Comes in the jelly form, with millions of live bacteria, with the patented ventilated stopper. For Peas, Beans, Alfalfa, Clovers, Vetches, Lespedeza, Cow Peas, Soy Beans, Peanuts, etc. Be sure you state for what crop you want your culture. All Legumes should by all means be inoculated before they are planted. The difference between an inoculated field and one that has not been inoculated will be seen in the quicker start it gets, growing off faster, maturing more evenly, and what is not so apparent, in the increased number of nodules on the roots.

In the price list below, SMALL SEEDS include Clovers, Alfalfa, etc.; LARGE SEEDS include Peas, Beans, Peanuts, Vetch, etc.

	Small Seeds	Large Seeds
1/2 bu.	.60	.35
1 bu.	\$1.00	\$.60
2 1/2 bu.	2.25
5 bu.	2.25
10 bu.	8.00

Semesan

The reliable Seed Disinfectant. It prevents or arrests practically all diseases of plants which are of a fungus or bacterial nature, especially those which are communicated through the seed, and also many diseases of the soil. It materially hastens germination as well as vitality. It is used in controlling potato scab, black rot, blight, anthracnose, smut, and many other bacterial and fungus diseases. It is a sure cure for brown patch on lawns and golf courses. Two to 3 ounces treat 1 bushel of grain; 1 ounce treats 15 lbs of small Vegetable Seed. Full literature gladly sent on request. Two ounces, 50c; 8 oz., \$1.60; 1 lb, \$2.75; 5 lbs, \$13.00. It is in violation of the Postal Regulations for Semesan to be sent by mail; therefore shipment can be made by express only.

In Planting All Legumes

We strongly advise the use of FARMOGERM. Even on lands that have already been planted to these crops, inoculation pays in giving a quicker and better stand, as well as greatly increased yields in hay and nodules on the roots.

Selected Peanuts

All of our stock is selected from good crops, and is re-cleaned, hand-picked, and will be found free from trash, stems, leaves, or pops. You can no doubt, buy "Farmers Stock" much less, but the use of this stock is not economical when the amount of loss is taken into consideration. Prices on Peanuts fluctuate, and we will be glad to name firm prices at any time.

Mixson's Lawn Grass Mixture

It is generally well known that the best lawn is composed of several different grasses. Our mixture contains several of the very best grasses for the South, and when properly sown and tended will give you a green, velvety lawn pretty near the entire year. Thorough preparation is absolutely essential. Do not use stable or barn yard manure, but a commercial fertilizer. Sow the seed carefully, broadcast, harrow or scratch in very lightly, and then if possible roll. One pound covers 200 square feet. Plant enough seed, or you won't get the desired results. lb, 55c; 5lb, \$2.50 postpaid; Not prepaid, 10lb, \$4.50; 100lb, \$40.00.

Alfalfa

Mixson's Eureka Corn

Mixson's Selected Seed Corns

Mixson's Eureka This variety is exclusively our own introduction and the best all-around Corn for planting in the South. For years we had been working for such a Corn, one that would have just the characteristics that this one has, and when we found it, we named it, "Eureka", meaning "I have found it." It is a two-eared variety with pure white grains, hard enough to resist weevils, and wedge-shaped enough so that there is no lost motion between the rows. This variety, therefore, shells out a very high percentage of corn to cob. Ears are good sized, filling out well to the end. Stalk is sturdy, fully able to carry the ears. Equally satisfactory for main crop planting, as well as for planting after truck crops. Our stock is very highly bred, the result of close selections, and ever since its introduction, one man has been doing the necessary work. What we mean to impress on our friends is that our stock is not "picked up," but comes from the same man year after year. He knows what we want, and takes pride in giving just that. Every ear is field-selected first, and then selections are made from this, before shelling. Other varieties have their good points, and are adapted for particular purposes, but for an all-around excellent Corn, we unhesitatingly recommend Mixson's Eureka.

Six Ear Prolific A wonderfully prolific variety, producing from four to seven ears. Corn and cob are white, and grain is fairly hard. Especially recommended for poor land. Grain is heavy, and cob is small.

Mixson's 10% Cob Bred and selected especially for its large percentage of grain to the cob. In fact repeated tests made in shelling have shown that it runs about 90 lbs of grain to 10 lbs of cob. It will average three ears to the stalk, both grain and cob are white. Grains are wedge-shaped and very closely set on the cob.

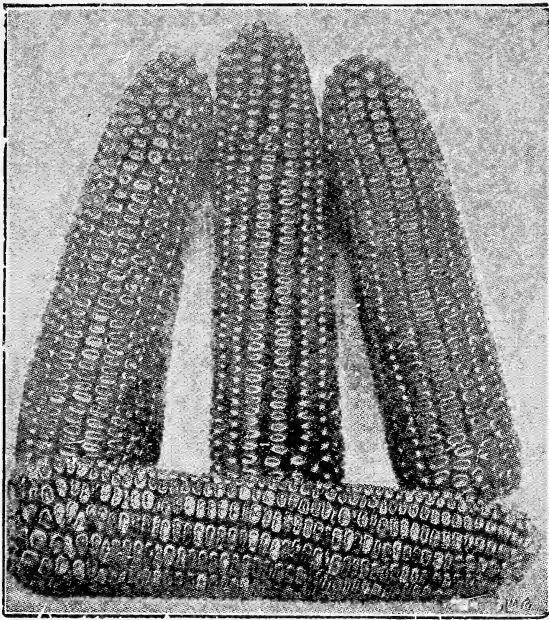

Marlboro Prolific A standard white variety, two good ears to the stalk. Grain is pure white, making excellent meal.

Hickory King The principal feature of this variety is the broad, flat, white grains, one of the grains very often covering a cross section of the cob. It roots deeply, and under average conditions two good ears can be counted on. It is generally recommended for planting on light soils. It is medium early and is very often used for roasting ears, following Improved Early White Dent, though we know of a good many farmers who still use it as their main crop variety.

Mosby's Prolific A very dependable variety, producing on an average of two good ears to the stalk. Grain and cob is white, latter being medium sized. Produces a good growth of fodder, the stalks being very sturdy. Grain is wedge-shaped, setting very closely on the cob.

Mixson's Red Cob A very large, single-eared variety, with white grain and red cob. Especially suited for planting in rich or bottom lands.

EARLY MATURING VARIETIES

Improved Golden Dent

Early Yellow Dent Practically identical with Early White Dent, except that the grain is yellow. Early maturing, averaging 20 rows to the ear, which is well filled. Grains are wedge-shaped, and very closely set.

Early Snowflake A white variety, earlier in maturing than Early White Dent. It is not generally planted for main crop, in fact it is not recommended for main crop planting, but it is valuable where a very early variety is wanted, either for grain, or for green feeding. It is also very commonly used for roasting ears, the grains being of superior quality, very tender and juicy.

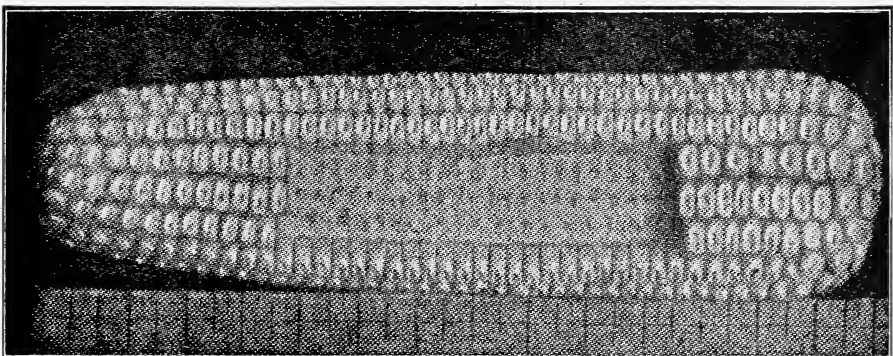

Mixson's Ensilage As its name implies, this is a silage variety, especially adapted to this purpose. It grows tall and very leafy, producing a big tonnage of broad, thick fodder, which is if the very best quality. In addition, it will average two good ears to the stalk, and for this reason it has made good yields of Corn and is sometimes used as a grain variety, though we do not especially recommend it as such. As a producer of green field or silage, however, Mixson's Ensilage has no superior and we believe that this excellent variety will entirely please you. We list only this one variety of Silage Corn, believing that you can do no better with any other sort.

Improved Early White Dent

Very generally planted where an early maturing variety of white corn is wanted, though we do not recommend it for main crop purposes. It is commonly classed as a 90 day Corn, grain and cob are white, and one to two ears to the stalk may be expected.

Improved Golden Dent

This is our very best yellow Corn. Grain is yellow, but generally is of a deeper color than the Early Yellow Dent. Grains are fairly broad and large, and are hard. They are closely and firmly set on the cob. Ears are well filled out. If you want an early yellow or Golden Corn, we recommend this strain.

Mixson's Productive Strains of Cotton

Are Highly Improved Selections of Standard Sorts and Will Produce Large Yields of Uniform Lint With a Strong Staple of Length Which Will Command the Highest Market Price and Greater Profit per Acre

The past season's over-production of Cotton and consequent low prices of seed and staple have given us something to think about. We must make more Cotton on less acreage and in order to do this we must use more care in preparation of land, cultivation and the selection of our **Seed Stock**. In fact the time has come when we must abandon old run-out, non-productive types of Cotton which have kept us poor for years and in their stead substitute **productive varieties** which have proven their worth and which we know to be good. Poor seed cannot produce a full crop even though all other conditions are favorable and lint of short and uneven staple cannot bring a price which will make us a living and keep us out of debt.

We have heard much talk and criticism about the shortness of staple produced in some sections of the belt and while this has been true to a great extent some unscrupulous buyers have taken advantage of this talk as an excuse for paying low prices. However, if you secure your seed from a reputable source and know what length your staple should be under average conditions, you can demand the price prevailing for that length of staple. All of our Cotton Seed are reliable and are priced so that the cost per acre in planting them is negligible when compared with the extra yield and profit obtained from their use.

Our Cotton Seed Department

In our Cotton Seed Department which is a separate division of our business we give all of our attention to Cotton Seed. It has been operating for years and in charge of a man of wide experience in this work—whose entire time is taken up with seeing that our customers are supplied with only **HIGH GRADE SEED**. He inspects the stock seed and is sure that their pedigree is reliable, he sees that the Cotton is dry and properly ginned on private gins where only one variety is ginned and that they are properly sacked in new 2½ bushel sacks and are well cared for up to the time of shipment.

Prices and Terms

Our prices are all F.O.B. Charleston, and subject to being unsold. Our terms are Cash with order, or we will ship Sight Draft, Bill of Lading attached, if you are known to us or if one-fourth of the amount in cash accompanies your order. We have low freight rates from Charleston and are prepared to make prompt shipment and quick deliveries. Send us your orders and we will give them the very best attention.

Mixson's Full Inch Cotton

Cotton Mills in many sections have been demanding a type of Cotton pulling a **FULL INCH** in length, not under 15/16" nor over 1—1/16". In fact a Cotton which will produce a good inch staple under average conditions. In many sections premiums are being offered for staple of this class and with this idea in view we went about developing a Cotton such as we have described—the result being

MIXSON'S FULL INCH which produces the staple as required above. In addition it is a large boll, 65 to the pound, an early maturer, mostly five-lock, close fruiter and linting around 40%. It is a heavy yielder—in fact an admirable type of Cotton, filling a long-felt want. We waited until we were positive we had what was needed. We are sure of it now and for the first time we offer our

MIXSON'S FULL INCH, back of which we put our reputation gained by years of hard work and honest dealing in the Seed Business. We want you to try this Cotton because we know it is the Cotton you want, that you will like it and that it will make more profit per acre for you. Our supply is somewhat limited this season so send in your orders early. Price per bushel, \$2.00; 10 bushels, at \$1.75; 25 bushels, at \$1.70; 100 bushels, at \$1.50 per bu.

Wannamaker Cleveland

This popular Big Boll Cotton is well known over the cotton belt. There are, however, many different strains, some of which do not measure up to the genuine type of this Cotton. This variety was bred in South Carolina and the best selected stocks are secured here. You will find that our strain matures hard fruit early, is a heavy producer, lints 38% to 40% and staples an inch, and, under favorable conditions, longer. The boll is large, running 60 to 65 to the pound and is a five-lock cotton. This variety is one that we recommend highly to our customers. Price per bushel, \$1.65; 10 bushels, at \$1.50; 25 bushels, at \$1.40; 100 bushels, at \$1.35.

Mixson's Extra Early Big Boll

We introduced this variety seven years ago and it still maintains its high standard of excellence. The bolls run 55 to 60 to the pound, the staple a good inch and an enormous bearer, producing 1100 pounds of Lint Cotton to the acre in tests at Clemson College, in competition with 68 leading varieties, and all of it was **harvested before October 7th**. We have sold this Cotton to our customers in all cotton growing states and results everywhere have been splendid. This Cotton is practically all five-lock and a good linter, running as high as 40%. Price, per bushel, \$1.70; 10 bushels, at \$1.55; 25 bushels, at \$1.45; 100 bushels, at \$1.40.

Mixson's Productive Strains of Cotton

(Continued)

Simpkins Big Boll Early The Simpkins Prolific and Ideal varieties have been well-known for years for their extreme earliness in maturing. However, a later selection known as Simpkins Big Boll Early has been developed and which we have been supplying to our trade for several years. It retains the very early maturing and heavy yielding characteristics of its predecessors and is extremely popular in many parts of the cotton belt. We do not hesitate to recommend it to anyone desiring an early maturing large boll type of Cotton that will produce well. Percentage of lint is 38 and bolls sixty-five to the pound. Price, per bushel, \$1.60; 10 bushels, at \$1.45; 25 bushels, at \$1.35; 100 bushels, at \$1.30.

Covington-Toole Wilt Resistant

Our strain of this Cotton withstands Cotton wilt better than any variety we have ever known. Our customers have planted it for years on the worst wilt lands with practically no loss from wilt. We cannot recommend it too highly. The boll is medium sized, staple 7/8" to 1", early maturing. Price, per bu., \$1.60; 10 bu., at \$1.45; 25 bu., at \$1.35; 100 bu., at \$1.30.

Deltatype Webber Has been planted in the Mississippi Delta with excellent results as to staple and yield. Some claim it earlier than Webber No. 49. Staple is 1-3/8". 60 to 65 bolls to the pound. Price, per bushel, \$1.65; 10 bushels at \$1.50; 25 bushels, at \$1.40; 100 bushels, at \$1.35.

Lightning Express A Staple Cotton running 1-3/16" in length—very early, bolls 70 to the pound, and has considerable resistance to blight or wilt. Price, per bushel, \$1.55; 10 bushels, at \$1.40; 25 bushels, at \$1.30; 100 bushels, at \$1.25.

If more information on any variety is wanted write for Cotton Seed Catalog, which gives more detailed information and testimonials from customers.

J. W. Butler, Gen. Manager Gill Plantation Cooperative Growers, Beloit, Ala.—"Our Cotton grown from your Wannamaker Cleveland is the best crop in ten square miles."

Merchants Grocery Co., Demopolis, Ala.—"Your Wannamaker Cleveland Seed gave perfect satisfaction."

T. A. Sawyer of Chesnee, S. C.—"I am glad to report my success with your Extra Early Big Boll."

T. G. McKenzie, of Kingstree, S. C.—"I am very much pleased with your Mixson's Extra Early Big Boll, made a profit of \$21.70 per acre more than a similar large boll cotton on my farm. I intend to plant my entire crop in it another year."

J. G. Day, Opp, La.—"Your Mixson's Big Boll Seed were just fine."

W. J. Busbee, Wagener, S. C.—"I found your Covington-Toole Cotton strictly wilt resistant."

Simpkins Ideal Considered by many to be the earliest maturing variety of Cotton known. 90 days from the planting to the boll and noted for its heavy fruiting. Lint, 41%, staple 7/8". Medium boll. Price, per bu., \$1.55; 10 bu., at \$1.40; 25 bu., at \$1.30; 100 bu., at \$1.25.

Improved King Claimed by many to be as early as Simpkins Ideal. Boll used to be small, but since improved, size has increased until now it is fairly large. Lint 39%, staple 7/8". Small plant growth, closely fruited. Price, per bu., \$1.55; 10 bu., at \$1.40; 25 bu., at \$1.30; 100 bu., at \$1.25.

We can also supply other varieties as follows: **IMPROVED POULNOT, MONEYMAKER, BANK ACCOUNT, TOOLE PROLIFIC**, and others at the following prices: Per bu., \$1.55; 10 bu., at \$1.40; 25 bu., at \$1.30; 100 bu., at \$1.25.

Webber No. 49 Early maturing variety of upland long staple, large boll, 65 to the pound; staple 1-5/16" to 1-3/8". Probably more largely planted than any other staple Cotton. Price, per bu., \$1.65; 10 bu., at \$1.50; 25 bu., at \$1.40; 100 bu., at \$1.35.

Half and Half Named for its extra large percentage of lint which has been known to go as high as 50%. However, under average conditions will go from 44% to 46%. Staple 7/8" to 1", medium boll and fairly early in maturing. Well-liked and largely planted in some sections. Price, per bu., \$1.60; 10 bu., at \$1.45; 25 bu., at \$1.35; 100 bu., at \$1.30.

Wannamaker-Cleveland Cotton

Insecticides, Fungicides, Sprayers, Etc.

Please Note That Some Articles on This Page on Account of Their Poisonous Nature Cannot be Mailed. Shipment, Therefore, Can be Made Only by Express or Freight

Arsenate of Lead (DRY POWDER)

For all leaf eating insects including potato bugs, tobacco worms, etc. Sticks to the leaf much better than Paris Green, does not burn the foliage, and it has, therefore, very largely taken the place of Paris Green. Use either dry, dusting on the plant, or in solution at the rate of about 2 lbs to 50 gallons of water. ½ lb, 25c; 1 lb, 40c; 4 lbs, \$1.20; 48-lb carton (containing twelve 4-lb packages), \$12.00. Cannot be mailed.

Calcium Arsenate

The very best insecticide for boll weevil. Our brand is very high grade, conforming in every way to government specifications. 25 lbs, \$3.50; 100 lbs, \$12.00. Cannot be mailed.

Bordeaux Mixture

The standard fungicide for control of blight on potatoes, cucumbers, melons, tomatoes. Greatly improves the quality of the fruit, as well as increasing the yield, and systematic sprayings will pay good profits. Bordeaux mixture is made in different degrees of strength, ours being the very highest, containing 20% metallic copper by guarantee, and when using Bordeaux of this strength, 5½ lbs is needed to 50 gallons of water, to make a 4-4-50 mixture. If desired, a combined insecticide and fungicide can be made, by adding both Arsenate of Lead and Bordeaux to the water and applying in one operation. Our Bordeaux can also be applied dry, as a dust. 1 lb, 40c; 5 lbs, \$1.75; 25 lbs, \$6.25; 100 lbs, \$20.00. Can be mailed. If wanted parcel post, add postage.

Nicotine Dust

For aphids, lice, and all other leaf-sucking insects. Apply as a dust, on a clear, still day, only. The insects are killed by fumes, and this is necessary. 20 to 25 lbs will be necessary for an acre. 25 lbs, \$4.50; 50 lbs, \$10.00; 100 lbs, \$19.00. Cannot be mailed.

Black Leaf (NICOTINE SULPHATE)

Contains 40% nicotine in solution, and used for leaf-sucking insects. 1 lb makes from 100 to 125 gallons. Spray on the plants thoroughly, preferably under pressure. 1 oz., 35c; ½ lb, \$1.25; 2 lbs, \$3.50; 10 lbs, \$13.50. Cannot be mailed.

Dry Lime Sulphur

The universally used remedy for San Jose Scale. Ours is in the dry form, and all you have to do is to add water. In this way you save express or freight on the water you get in Lime Sulphur already mixed. For a dormant or winter spray, use 12 lbs to 50 gallons of water. For summer spraying use 2½ lbs to 50 gallons. If you wish to kill insects at the same time, arsenate of lead may be added.

Spray Pumps

Auto Spray No. 1-D

An extremely well constructed sprayer, working by means of compressed air, which is forced in by means of a few strokes of the plunger. It has an automatic shut-off at the nozzle. Made of heavy galvanized steel, sprays all liquids or insecticides, etc., in solution successfully, and with proper care, will last many years. Capacity of tank 3½ gallons.

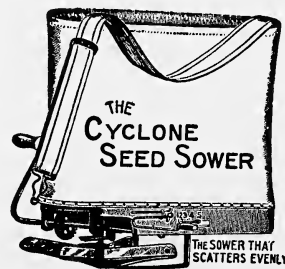

Price: \$6.80, postpaid; not prepaid, \$6.50.

Triumph Hand Dusters

The very best machine of its kind for the application of any powdered insecticide or fungicide. Strongly made, every working part being made of wrought steel and all parts on which wear might occur are made of hardened steel. Ball bearings are used. Packed in individual cases. Price, \$8.00, not prepaid.

Cyclone Seed Sowers

This sower is guaranteed to distribute seed perfectly evenly, will not throw it in an upward direction against the operator, but directly on the ground. The flow can be regulated and it sows clover, alfalfa, oats, rye, wheat, millet, and in fact, all kinds of

farm seed which are sown broadcast. It also distributes fertilizer, land plaster, etc. Clover Seed is sown a width of 18 feet; wheat, 25 feet; millet, 18 feet, and one operator can sow from 40 to 60 acres a day. This sower is a most valuable thing to have on any farm, and pays for itself over and over again. Price, postpaid, \$2.20.

Large Truckers or Associations who use these goods in large quantities are asked to write us for special prices. We are large dealers in these items and on quantity lots, are prepared to figure very close. At the same time, if you are interested in any other insecticide or fungicide, we can probably quote you to advantage and will appreciate an opportunity.
